1. Introduction

2. Definitions

Foundational to our task are the different kinds of *Infinite Games* and how to determine the outcome of each such game. To do so, we also want a notion of *strategies* on such Infinite Games. To later reduce the games to one another, we furthermore want a definition of a *Reduction* in the computational complexity sense.

2.1. Directed Graphs

Let V be a finite set of Vertices, let $E \subseteq V \times V$ be a set of Edges, then $G = (V, E)$ is a *Directed Graph*. We also define $src: E \rightarrow V$ as $src((u, v)) = u$ and $tgt: E \rightarrow V$ as $tgt((u, v)) = v$.

2.2. Arenas

An arena is an extension of Directed Graphs, where the set of Vertices, V , is partitioned into two disjunct subsets V_0 and V_1 , respectively denoting the regions where player 0 and player 1 are to play. We also require that the out-degree of every vertex is at least one, so that any play on the Arena can always be prolonged.

Formally, let (V, E) be a non-trivial Directed Graph, $V_0 \cup V_1 = V$, $V_0 \cap V_1 = \emptyset$ be a partition of V and $\forall v \in V: \exists e \in E: src(e) = v$, then $A = (V, (V_0, V_1), E)$ is an Arena.

2.3. Positions, Moves

A *position*, $\pi_i = (v_0, v_1, \dots, v_i)$, in a Game describes a finite path on the underlying graph, i.e. a position is an element of V^+ .

A *move* is an extension of a position by one more step in the graph. E.g. $\pi_i \mapsto \pi_{i+1}$ for $(v_i, v_{i+1}) \in E$. Player P as in $v_i \in V_P \in (V_0, V_1)$ chooses the move.

2.4. Strategies

A *strategy*, $V^* \times V_P \rightarrow V$, is a function by which player P choses the next move for any given position.

We call a strategy *memoryless* if for any given position the next move only depends on the last vertex of the position, i.e. $V_P \rightarrow V$. We will refer to memoryless strategies of player 0 as σ and of player 1 as τ .

2.5. Plays

A *play* describes the path of arbitrary length $\langle v_0, v_1, \dots \rangle$ the player go through in the process of playing the game. We refer to the play generated by applying strategies σ, τ to game G starting at $v_0 \in V$ as $\pi_{\sigma, \tau}(G, v_0) = \langle v_0, v_1, \dots \rangle$

2.6. Infinite Games

Infinite Games are a category of games played by two players on a finite, directed graph. They are infinite in the sense that we require the out-degree of every vertex to be at least one. As such, regardless of the strategies chosen by the players, they never terminate.

2.6.1. Parity Games

Parity Games are played by two players, *Even* or player 0, also represented by \square and *Odd* or player 1, also represented by \circ .

A Parity Game, $PG = (A, p)$, is played on an Arena A with a priority function $p: V \rightarrow \{0, 1, \dots, |V|\}$.

Let $\pi_{\sigma, \tau}(PG, v_0) = \langle v_0, v_1, \dots \rangle$ be the *play* resulting from applying the strategies σ and τ to Parity Game PG .

Let $\#_{\infty}(\pi_{\sigma, \tau}(PG, v_0)) = \{i \in \langle p(v_0), p(v_1), \dots \rangle \mid \forall j \in \mathbb{N}: j < |\langle v \in \langle v_0, v_1, \dots \rangle \mid p(v) = i \rangle|\}$ be the set of priorities that appear arbitrarily often in the play. If $\max(\#_{\infty}(\pi_{\sigma, \tau}(PG, v_0)))$ is Even, then *Even* wins and vice versa.

2.6.2. Mean Payoff Games

Mean Payoff Games are played by two players, *Max* or player 0 (\square) and *Min* or player 1 (\circ).

A Mean Payoff Game, $MPG = (A, \nu, d, w)$, is played on an Arena A , with threshold $\nu \in \mathbb{Z}$ and an edge-weight function $w: E \rightarrow \{-d, \dots, -1, 0, 1, \dots, d\}$, $d \in \mathbb{N}_0$.

Max wins play $\pi_{\sigma, \tau}(MPG, v_0) = \langle v_0, v_1, \dots \rangle$ if

$$\liminf_{n \rightarrow \infty} \left(\frac{1}{n} \sum_{i=0}^{n-1} w((v_i, v_{i+1})) \right) \geq \nu.$$

2.6.3. Energy Games

Energy Games are played by two players, *Charging* or player 0 (\square) and *Depleting* or player 1 (\circ).

An Energy Game, $EG = (A, c, d, w)$, is played on an Arena A , with credit $c \in \mathbb{N}_0$ and an edge-weight function $w: E \rightarrow \{-d, \dots, -1, 0, 1, \dots, d\}$, $d \in \mathbb{N}_0$.

Charging wins play $\pi_{\sigma, \tau}(EG, v_0) = \langle v_0, v_1, \dots \rangle$ if

$$\forall k \in \mathbb{N}_0: \left(\sum_{i=0}^k w((v_i, v_{i+1})) \right) + c \geq 0.$$

For any given position $\langle v_0, v_1, \dots, v_k \rangle$ in a play we call $\left(\sum_{i=0}^{k-1} w((v_i, v_{i+1})) \right) + c$ the *energy level* at that position. Keep in mind that *Charging* doesn't necessarily aim to maximise their energy level at *any* specific position but rather to maintain a non-negative energy level at *every* position. In a sense, they aim to minimise the c necessary to maintain the winning condition for any given position of a play.

2.6.4. Discounted Payoff Games

Discounted Payoff Games are played by two players, *Max* or player 0 (\square) and *Min* or player 1 (\circ).

A Discounted Payoff Game, $DPG = (A, \nu, d, w, \lambda)$, is played on an Arena A , with threshold $\nu \in \mathbb{Z}$, an edge-weight function $w: E \rightarrow \{-d, \dots, -1, 0, 1, \dots, d\}$, $d \in \mathbb{N}_0$ and a discount factor $0 < \lambda < 1$.

Max wins play $\pi_{\sigma, \tau}(DPG, v_0) = \langle v_0, v_1, \dots \rangle$ if

$$(1 - \lambda) \left(\sum_{i=0}^{\infty} \lambda^i \cdot w((v_i, v_{i+1})) \right) \geq \nu.$$

2.7. Simple Stochastic Games

Simple Stochastic Games are played by two players, *Max* or player 0 (\square) and *Min* or player 1 (\circ).

A Simple Stochastic Game, $SSG = (G, (V_0, V_1, V_2), V_-, V_+, p)$, is played on a Directed Graph G , with a partition (V_0, V_1, V_2) , two sink vertices V_-, V_+ and a probability function $p: E \ni (V_2 \times V) \rightarrow (0, 1]$. We require that the probabilities of all outgoing edges of each V_2 vertex sum to 1:

$$\forall v \in V_2: \left(\sum_{e \in E: \text{src}(e)=v} p(e) \right) = 1$$

We also require that the out-degree of every vertex is at least one, with the exception of V_0, V_1 , for which it is zero. We say that a SSG is *stopping* if for every possible position in a play there is a path to one of the sink vertices.

Max wins if the V_+ sink is reached, *Min* wins if the V_- sink is reached or the game doesn't terminate. Since the result of a play $\pi_{\sigma, \tau}(SSG, v_0)$ can be probabilistic, it is assigned a probability to reach the V_+ sink rather than a fixed value. Since SSGs can terminate, they are not Infinite Games. For simplicity, we henceforth still colloquially include SSG under the label *Infinite Games*. Note that plays of non-stopping SSGs may still be arbitrarily long.
